PATIENTS**

The better
monofocal-toric
IOL

LENTIS[®] QUANTUM[®] toric

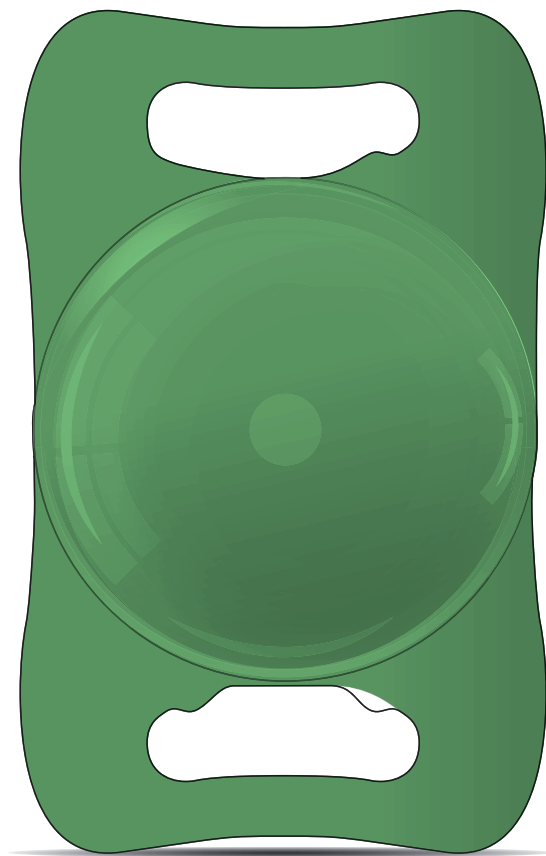

Dear Patient,

Nowadays, nobody must endure visual impairments due to cataract and astigmatism. Modern ophthalmology has excellent options for aiding quickly, painlessly and permanently.

Treatment with a LENTIS® Quantum^{toric} intraocular lens (IOL) can achieve a new level of visual comfort that goes beyond a standard monofocal lens solution.

The LENTIS® Quantum^{toric} offers better vision due to more depth of focus and a toric correction!

For reading and close-up work, you will still need reading glasses.

Discuss with your ophthalmologist, whether the LENTIS® Quantum^{toric} is the intraocular lens that will benefit you the most!

Vision with cataract
and astigmatism

expected and potential outcome

Astigmatism

What is that?

Patients suffering from astigmatism do not have evenly round corneas, rather corneas with various curvatures (bumps and dips) in different directions.

There is a difference between genetic regular and irregular astigmatism. The latter can also be caused by eye disorders, such as inflammation of the cornea or cataracts.

Cataracts

What is that?

Cataract is the clouding of the originally clear lens of the eye, which usually affects both eyes.

It may look like trying to see through fog, which gets thicker over time. Your vision becomes increasingly blurry, and images lose intensity and colour.

Sharp and
high-contrast vision

expected and potential outcome

Both eye conditions treated in one procedure?

The only successful treatment option to treat cataracts is surgery, whereby the natural lens is removed and replaced by an artificial monofocal intraocular lens.

With a patient-matched monofocal-toric lens, like the LENTIS® Quantum^{toric}, the astigmatism is treated simultaneously.

Cataract surgery is one of the most common operations with over 28 million procedures worldwide each year. It's a routine operation with a very low complication rate.
